

## **Reviewer's report**

**Title:** Comprehensive Expressional Analyses of Antisense Transcripts in Colon Cancer Tissues Using Artificial Antisense Probes

**Version:** 2 **Date:** 29 November 2010

**Reviewer:** Andreas Werner

### **Reviewer's report:**

I had another look at the manuscript and it definitely reads much better.

The authors answered the criticisms to my satisfaction. There is one little detail that the authors should clarify: To me, the sentence "These results are consistent with pervious reports suggesting that these RNAs are possibly associated with transcription." needs specification (what aspect of transcription). The manuscript adds to the growing evidence that antisense transcription is related to cancer (a PNAS manuscript in press corroborates the findings). In this form, it is definitely worth publishing.
